

CS 3600 Testimonials

CS 3600 Testimonial from John M. Barksdale, D.D.S.:

“We installed the most recent upgrade to our CS 3600 and the results are impressive, to say the least!

Upgrades often cause glitches, but everything went smoothly. Speed of data capture is even better than before and I love the immediate refinement feature.

The way I practice has changed over the past twelve months and Carestream Dental products play a major role.

We are fully engaged in Digital Workflow, it has dramatically impacted how I gather records, diagnose, treatment plan, and deliver patient care.

Intraoral impression scanning and CBCT are the keys to what is happening. I am very happy with my CS 3600 Intraoral Scanner and the 9300 CBCT.”

-John M. Barksdale, D.D.S.

CS 3600 Testimonial from Stephen D. Poss, D.D.S.:

“Intraoral scanning makes our process much easier and simpler from the standpoint of accuracy and workflow. There’s no worrying about packing up models and sending them to the lab. I tell my patients, ‘Usually before the temporary crown is on, the case has already been delivered to the lab.’ So expediency is a very important aspect, in addition to accuracy.

The CS 3600 is very intuitive. It’s easy enough that you can delegate the process of scanning. We had one day of Carestream Dental training, but after that my assistant began using it immediately to scan opposing arches and get things ready for me. The system prompts you at every stage. The images are so fast and clear, which is the biggest thing for me—whether it’s a single crown or quadrant or full arch.”

-Stephen D. Poss, D.D.S.

CS 3600 Testimonial from Christopher T. Harris, D.D.S., M.S.:

“I have no hesitation in recommending the CS 3600 intraoral scanner. It is extremely easy to work with. We are able to do full scanning with both arches and bite registration in six minutes.

The refinement capabilities are amazing, automatically removing extraneous and irrelevant data—like the tongue or the cheek—*without* requiring us to go back and actively erase and rescan. We end up with an accurate, distortion-free representation of our patients' teeth every single time.

There's also tremendous workflow improvement. Using the CS 3600 has allowed us to complete treatment with fewer appointments and significantly cut the turnaround time for creating appliances.”

-Christopher T. Harris, D.D.S., M.S.

CS 3600 Testimonial from Dr. Robert Waugh:

“We needed a good, reliable scanner that we could go the distance with. The CS 3600 intraoral scanner is the preferred scanner in my practice. The refinement is faster and my staff can get in and get the job done in a quick but accurate way. The scanner is comfortable to use; lightweight and portable. It's very slick.

When you invest in a scanner, you want something that's easy to train on and you want to look for a company that's going to stand behind its product. Carestream Dental has both of those things. Its product—the CS 3600—is well-designed and ergonomic. The company is looking ahead; the scanner isn't something you're going to have to replace in a year. The people and labs I work with recognize Carestream Dental as a great company and know the CS 3600 is a highly accurate scanner. They're eager to work with my practice because they know we have the best technology.”

CS 3600 Testimonial from Dr. Richard Steinberg:

“In our opinion, the CS 3600 intraoral scanner is superior. It's faster and makes image capture quite easy. We're totally blown away. The HD 3D imaging is fantastic since you can see the color of the tooth, gums and margins much clearer. I love it, and everybody in my office who uses it loves it.

The CS 3600 allows my assistants to go and scan everything before I even get to the chair—whether it's the whole arch or just half an arch. I then prepare the tooth, cut out the prepared area on the scan and then rescan that spot. Doctor time for the scan is about one minute.

The CS 3600 has become a vital part of our practice.”

CS 3600 Testimonial from Dr. Paul G. Trotter:

“The software of the CS 3600 is truly impressive. You can scan over debris (tongue, gloves, cheek, etc.) without having to remove it. Recently, we had one of the toughest patients to scan that I have ever seen. His tongue was everywhere. We eventually managed to capture about two seconds’ worth of scanning of the lingual of the lower molars. The rest of the lingual was just scans of the tongue. However, the software refined out all of the tongue and none of the lingual of the lower molars. We were all amazed! The CS3600 has allowed us to adjust our workflow to complete all of our initial records in 15-20 minutes. This includes photographs, panoramic images, cephalometric images, AND a digital impression that is both lab ready and patient-presentation ready! The best way to summarize is this: our staff now argues over who gets to scan—instead of who has to scan!”

CS 3600 Testimonial from Dr. Mark Causey:

“Since using the CS 3600, I’ve been impressed, not only with the speed, but with the accuracy of the scanner. We have made several appliances using the digital files from the CS 3600, and they tend to fit better than appliances made using our traditional impressions.”
