

## CS 9600 Testimonial

### **CS 9600 Testimonial from Dr. Matthew Nichols:**

"I decided to upgrade to the CS 9600 system for two main reasons: ease of use (for my staff) and superior image quality.

With the addition of smart features, such as the 'live positioning assistant' cameras, it's quite simple for my staff to easily and efficiently position the patient in order to get precisely the image we need. There's also that "wow" factor that patients experience when they can see the touch screen and view the results instantly.

The 120kv imaging and CS MAR (metal artifact reduction) feature also continue to impress me. I often work with patients who have been heavily restored, which could require multiple scans to have a guide made. Now, with the metal artifact reduction, we can cut that down just to one scan and create a well-fitting guide easily. It's also been helpful with post-operative imaging; thanks to the low-dose imaging (not more than a periapical), we can take a 3D scan instead of a panoramic to get instant three-dimensional feedback.

When combined with the Prosthetic-Driven Implant Planning module and the CS 3600 intraoral scanner, I find that planning my cases is much easier. You can plan out an entire implant case in front of the patient in only five minutes. And, because of the open file formats, I am able to take advantage of third-party surgical planning software to print the guides within my office.

All in all, I would say that you can't beat the CS 9600."
